Chest Pain (CP) type per target

Oldpeak grade per target

Summary of the study:

Chest Pain Type (cp): Asymptomatic patients show the highest prevalence of heart disease. Typical and atypical angina are much less associated with disease.

Coronary Vessels (ca): The strongest predictor in the dataset. Disease probability rises sharply with 1, 2, or 3 blocked vessels.

Sex Differences: Men show higher and earlier heart disease rates. Women develop disease later in life, after age 55–60.

Age Coverage: The dataset includes a balanced range of ages (29–77), supporting reliable comparisons.
